IDAHO ECONOMIC FORECAST 2008 - 2011

State of Idaho
C.L. "BUTCH" OTTER
Governor

PREFACE

Idaho's economy continues to grow and evolve as it enters the 21st Century. The 1980s was a decade of stop-and-start economic performance. However, it also ushered in one of the longest expansions in the state's history. Since 1987, nonfarm employment has expanded every year and has consistently placed Idaho among the top ten fastest growing states in the nation. The 1990s saw a flood of new residents move into the state, causing the population to expand by an astounding 29% from 1990 to 2000. Over this period Idaho personal income nearly doubled. Much of the current expansion results from ongoing structural changes in Idaho's economy.

One of the biggest changes is the rise of the state's high-technology sector. Virtually nonexistent in the 1970s, this sector achieved critical mass in the 1990s to become the state's largest manufacturing employer. The growth of industry giants, such as Micron Technology and Hewlett-Packard, as well as the emergence and expansion of smaller companies, pushed payrolls above even the most optimistic forecasts made in the 1980s. The state's trade sector has also been going through a transformation. The last decade witnessed an influx of national "big box" merchandisers. During this same time, Idaho merchants successfully reached beyond the state's borders. Several regional shopping centers were established that serve locals, as well as attract shoppers from other states and Canada. Visitors fueled the surge in tourism that also benefited trade. Like its national counterpart, the service sector accounts for most of the nonfarm jobs in Idaho. Tourism has also been a boon to the service industry. While traditional factors, such as increasing discretionary income, continue to fuel the demand for services, other influences have emerged. For example, the use of temporary employees in manufacturing has bolstered business services employment. Idaho's outstanding work force has been a major factor in attracting call centers, back office operations, and credit card companies.

While many changes are taking place today, traditional resource industries still play a major role in Idaho's economy. Indeed, the state's mining, agriculture, and timber sectors all experienced lulls in the late 1990s. While displaying more resilience to downturns than in the past, these industries are not totally immune from business-cycle effects. The continuing dependence on natural resources will bring a host of challenges to Idaho.

Other factors that are external to the state's economy will also present challenges to decision makers. Public policy decisions made in Washington, D.C. affect resource industry and federal installations such as the Idaho National Laboratory and the Mountain Home Air Force Base. Finding balanced and acceptable solutions to endangered and threatened species issues and timber supply issues are of major economic significance.

In order to deal effectively with these challenges, public and private decisions need to be made with a thorough understanding of the structure of the state's economy. It is to this end that the *Idaho Economic Forecast* is directed.

INTRODUCTION

The national forecast presented in this publication is the July 2008 Global Insight baseline forecast of the U.S. economy. The previous *Idaho Economic Forecast* is based on the April 2008 Global Insight baseline national forecast.

The cover graph shows the U.S. civilian unemployment rate will creep up through next year to a level that is above what is considered a normal level of unemployment. The unemployment rate is expected to decline in the last two years of the forecast, but not enough to drop it below this threshold. The reason for the high unemployment is due partly to the forecast of slow job gains over the forecast period, especially in 2008 and 2009. During these two years, U.S. nonfarm employment growth virtually stalls, gaining less than 50,000 jobs. The pace of hiring does pick up beginning in 2010, but the average annual pace for that year and 2011 is just 1.6%.

FEATURE

The feature article, "Consumer Sentiment and Consumer Spending," was written by Dr. James A. Wilcox. It describes how the University of Michigan's Index of Consumer Sentiment (ICS) is constructed and reviews some past research on whether measures of consumer attitudes improve forecasts of consumer spending. He also reports on some new research, which found that using the answers to the individual component questions of the ICS, rather than the ICS itself, further improved forecasts of personal consumption expenditures and its components. Finally, it shows how much and when measures of consumer attitudes might have helped forecasts in recent years. Dr. Wilcox's report is particularly timely given the recent slide in consumer confidence. Dr. Wilcox is a Visiting Scholar at the Federal Reserve Bank of San Francisco and Professor at UC Berkeley's Haas School of Business.

THE FORECAST

Alternative assumptions concerning future movements of key economic variables can lead to major variations in national and/or regional outlooks. Global Insight examines the effects of different economic scenarios, including the potential impacts of recessions, higher inflation, and future Federal Reserve Board decisions. Alternative Idaho economic forecasts were developed under different policy and growth scenarios at the national level. These forecasts are included in this report.

Historical and forecast data for Idaho and the U.S. are presented in the tables in the middle section of this report. Detail is provided for every year from 1994 to 2011 and for every quarter from 2005 through 2010. The solution of the Idaho Economic Model (IEM) for this forecast begins with the second quarter of 2008.

Descriptions of the Global Insight U.S. Macroeconomic Model and the IEM are provided in the Appendix. Equations of the IEM and variable definitions are listed in the last pages of this publication.

CHANGES

The Idaho Department of Labor provides monthly historical employment data that are seasonally adjusted and converted to quarterly frequencies by the Idaho Division of Financial Management (DFM). These adjusted data include final employment numbers through the first quarter of 2008 and estimates for the second quarter of this year. These data show Idaho total nonfarm employment was 89 jobs lower in the fourth quarter of 2007 than had been reported in the April 2008 *Idaho Economic Forecast* and there were 3,161 fewer jobs in this year's first quarter than had been earlier forecast.

The tables in this forecast include the U.S. Bureau of Economic Analysis' (BEA) June 19, 2008 estimates of Idaho quarterly personal income through the first quarter of 2008. The next round of Idaho quarterly personal income estimates is scheduled to be published on September 18, 2008 and will run through the second quarter of 2008. These estimates will be incorporated into the October 2008 *Idaho Economic Forecast*.

Readers with any questions should contact Derek Santos at (208) 854-3070 or at dsantos@dfm.idaho.gov.

EXECUTIVE SUMMARY

The outlook for Idaho's economy has been scaled back to reflect more current Idaho historical data and the revised national forecast. A review of new employment data shows the state's economy grew slower during the first part of this year than had been anticipated in April 2008. It was previously projected that nonfarm employment would drop at a 0.3% annual pace in this year's first quarter and grow at a 0.9% clip in the second quarter. Newer job data show employment performed worse than this meager forecast. Namely, nonfarm employment fell at a 2.2% rate in the first quarter and dropped by 0.4% in the second quarter of 2008. As a result of this change, the starting point for the Gem State's employment forecast has been lowered from the previous forecast's 659,800 jobs to 654,595 jobs in the current forecast. The current national economic forecast contains a recession. The combination of the lower starting point for the Idaho employment forecast and weaker near-term U.S. economic growth does not bode well for the local economy. Under these conditions Idaho nonfarm employment is expected to expand 1.3% annually over the forecast period, with the first two years being particularly weak. As a result of the slower growth, there are about 17,500 fewer jobs in 2011 in the current forecast than in the previous one. Idaho nominal personal income also falls victim to the weaker national economy. The gap between the current and previous forecast widens over time, so that by 2011 Idaho nominal personal income is \$645 million lower than in the previous forecast. Because inflation is higher in the current forecast, the difference between the current and previous measures of Idaho real personal income in 2011 is even more pronounced. In summary, the next couple of years will be the most challenging in decades for the state's economy.

Earlier this year, the consensus among most business cycle handicappers was the economy would slip into a recession in the first half of 2008. In its July 31, 2008 report, the U.S. Department of Commerce estimated real GDP actually grew at a 0.9% clip in this year's first quarter and 1.9% in its second quarter. The real GDP growth during the first half of this year does not mean a recession has been avoided. Instead, it has been postponed. This prognosis reflects that many of the threats to the economy earlier this year remain. Granted, their impacts are likely to be offset in the third quarter by a temporary spike in consumer spending fueled by the tax rebate checks. However, the challenges facing the economy will remain after the checks are spent. Real GDP is expected to retreat at a 1.7% annual rate in the fourth quarter of 2008 and decline 0.7% in the first quarter of 2009. On an annual basis, real GDP is forecast to advance just 1.6% this year and 0.9% next year—its slowest growth since 2001. Like the previous recession, the forecasted slowdown should be mild compared to other post-war slowdowns. The economy is expected to remain sluggish through the first half of 2009. Real GDP is expected to pick up speed with abating negative factors. Inflation moderates. Hiring picks up. Credit becomes more available. And housing recovers. As a result, real GDP is projected to advance 3.6% in 2010 and 3.4% in 2011.

National Variables Forecast by GLOBAL INSIGHT Forecast Begins the SECOND Quarter of 2008

NATIONAL FORECAST DESCRIPTION

The Forecast Period is the Second Quarter of 2008 through the Fourth Quarter of 2011

The good news is most economists were wrong. Earlier this year, the consensus among most business cycle handicappers was the economy would slip into a recession in the first half of 2008. In our April 2008 *Idaho Economic Forecast* we reported real GDP would shrink at a 0.1% annual rate in the first quarter of this year followed by a 0.7% decline in the second quarter, which fits the rule-of-thumb definition of a recession. This forecast was made by Global Insight, Inc. based on a thorough evaluation of factors that would shape the economy's course. Given the threats of inflation, job losses, tight credit, the housing crises, the forecast of a U.S. recession seemed at the time to be almost a sure thing. Of course, there is no such thing as a sure thing (or free lunch). In its July 31, 2008 report, the U.S. Department of Commerce estimated real GDP actually grew at a 0.9% clip in this year's first quarter and 1.9% in its second quarter.

The bad news is positive real GDP growth during the first half of this year does not mean a recession has been avoided. Instead, it has been postponed. This prognosis reflects that many of the threats to the economy earlier this year remain. Granted, their impacts are likely to be offset in the third quarter by a temporary spike in consumer spending fueled by the tax rebate checks. However, the challenges facing the economy will remain after the checks are spent. As a result, the expected recession that failed to materialize earlier this year will appear at year's end. Real GDP is expected to retreat at a 1.7% annual rate in the fourth quarter of 2008 and decline 0.7% in the first quarter of 2009. On an annual basis, real GDP is forecast to advance just 1.6% this year and 0.9% next year—its slowest growth since 2001. Like the previous recession, the forecasted slowdown should be mild compared to other post-war slowdowns.

In fact things could be worse. A deeper economic downturn is explored in the Alternative Forecasts section of this publication. A summary of those findings is included here. It assumes the housing recession deepens even more than in the baseline and the price of oil shoots above \$160 per barrel this summer. Despite the effects of the stimulus package, real GDP tumbles. After the impact of the stimulative monetary and fiscal policies wear off, the economy contracts over two additional quarters. Peak to trough, real GDP shrinks 1.7% during these three quarters (2008:3 to 2009:1). Like the recessions of 1991 and 2001, this one is still mild compared with earlier postwar recessions. Unlike the past two recessions, however, the economy remains on the ropes longer and emerges from the downturn weaker, facing more troubles ahead. The good news is it is believed there is just a 20% chance of this happening.

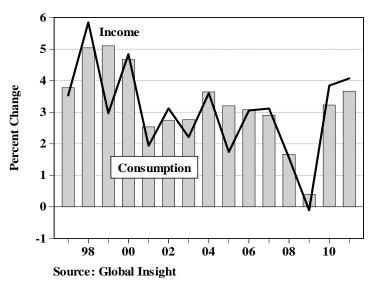

Equally likely is things could go slightly better than expected. This could happen if stronger productivity gains, coupled with renewed optimism, facilitate enhanced business spending and a milder housing contraction. The stimulus package already in the pipeline adds fuel to the fire during the latter half of 2008. Combined with a stronger currency, the productivity gains also help to contain inflation. Foreign economic growth is also stronger, which helps boost U.S. exports and domestic manufacturing. As a result, real exports rise faster despite the stronger greenback. Finally, this scenario assumes energy prices are lower than in the baseline. Most notably, under these conditions, the economy avoids a recession.

Getting back to the original forecast, the economy is expected to remain sluggish through the first half of 2009. Real GDP is expected to pick up speed with abating negative factors. Inflation moderates. Hiring picks up. Credit becomes more available. And housing recovers. As a result, real GDP is projected to advance 3.6% in 2010 and 3.4% in 2011.

SELECTED NATIONAL ECONOMIC INDICATORS

Consumer Spending: The salvo of negative economic news in recent months caused consumer confidence to sink earlier this year to its lowest level since 1992. However, consumers' actual spending habits have been impacted less than their psyches. That is, real spending still managed to plod along at a 1.1% annual pace in this year's first quarter despite consumers' souring moods thanks to spending on services that expanded at a 3.1% clip. Other spending categories did not fare as well. The biggest hit was in durable goods, which retreated at a 6.0% pace. This decrease reflected huge declines in motor vehicle-related spending. Hardest hit was new light truck sales, which declined nearly 30% in the first quarter. Unfortunately, truck sales are expected to significantly deteriorate throughout the year. Spending on nondurable goods

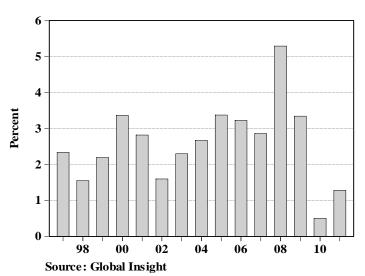

U.S. Real Consumption and Disposable Income Growth

performed better; it was flat in the first quarter. However, some of its components were blasted by high energy prices. For example, real spending on gasoline and oil declined 5.1%. Fuel oil and coal spending retreated even further, dropping 20.1% in this year's first quarter. Total consumer spending is expected to grow faster beginning in the second quarter of this year, as consumers return to malls and big box stores with their federal tax rebate checks in hand. However, this will be a short shopping trip. Once the tax rebates are spent, real consumer spending is expected to recede. It should be pointed out that not all of this federal windfall will be spent like found money. Unfortunately, several factors suggest consumer confidence and spending will remain subdued over the near term. Most notably, home prices are expected to continue falling this year, taking real household net worth with it. Rising unemployment and rising inflation increase consumers' uneasiness about the future. Under these conditions, consumers are expected to hunker down and spend more in line with their means. As a result, consumer spending should advance just 2.2% annually over the forecast period, which is lower than the anticipated growth of real disposable income. One positive impact of slower consumer spending is it will allow households to improve their balance sheets. For example, after plunging 10.3% this year, real net worth should slowly recover from this drop by 2011.

Inflation: Fueled by soaring energy and food prices, headline inflation is expected to jump this year, but it will not approach the levels reached in the late 1970s and early 1980s. Similarities between then and now make it tempting to assume history will repeat itself. In the earlier inflation episode, rapidly rising oil prices caused the average retail gas price to more than double over three years, from 64 cents per gallon to a peak of \$1.37 per gallon. In comparison, the retail price of gasoline is expected to peak at \$4.57 per gallon later this year, which is 84.2% higher than it was three years ago. Food prices display a similar pattern. During the earlier period consumer food prices, as measured by the consumer price index (CPI), increase by about 30% over three years. However, this same measure advanced less than half as fast (14.0%) in the most recent three-year period. Thus, while both periods are marked with rising energy and food prices, they rose much more steeply in the late 1970s and early 1980s. These differences help explain why overall inflation has been lower recently. However, they do not explain all

Consumer Price Inflation

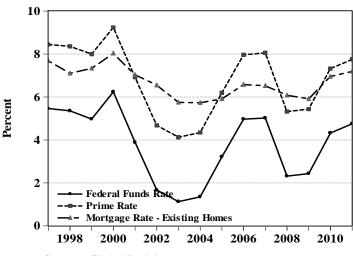

of the difference. During the late 1970s and early 1980s, employment expenses, as measured by unit labor costs, were advancing about 10% annually. More recently, they have been rising about 3% per year. This helps explain why total inflation is not roaring out of control and why it should not explode down the road. The reason for this is the U.S. labor market is expected to be relatively slack over the forecast period, so unit labor costs should be restrained. As a result, the core CPI rate all items less energy and food—should average just 2.2% over the next few years. Overall consumer inflation is 5.3% this year, 3.3% next year, 0.5% in 2010, and 1.3% in 2011.

Financial Markets: As expected, the Federal Reserve's Federal Open Market Committee (FOMC) voted earlier this summer to keep its bellwether federal funds rate at 2.0% in light of rising inflation pressures. In its June 25, 2008 statement, the FOMC said, "The substantial easing of monetary policy to date, combined with ongoing measures to foster market liquidity, should help to promote moderate growth over time. Although downside risks to growth remain, they appear to have diminished somewhat, and the upside risks to inflation and inflation expectations have increased." The FOMC may have refocused its energies toward containing inflation, but it has not lost sight of promoting economic growth. The FOMC's June statement goes on to say, "The Committee will continue to monitor economic and financial developments and will act as needed to promote sustainable economic growth and price stability." Achieving this goal has grown more challenging recently, as the combination of rising inflation and slow economic growth have raised fears of stagflation. No one is anxious for this to occur because it took double-digit interest rates and a recession to remedy the country's last bout of

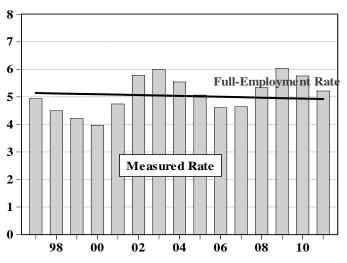

stagflation. Fortunately, the economy's current condition is not at the point that requires such a drastic monetary policy. Instead, it appears the nation's central bank has entered a period of watchful waiting to see whether its previously enacted interest rate cuts have their desired effects. Once the FOMC is convinced the economy is back on solid ground, it will begin to inch up the federal funds rate to starve future inflationary pressures. The current forecast assumes the next federal funds interest rate increase takes place in the second quarter of next year and peaks at 4.75% in the last quarter of 2010 and remains there for the remaining quarters of the forecast. The outlook for the federal funds rate and other key interest rates are illustrated in the accompanying chart.

Selected U.S. Interest Rates

Source: Global Insight

U.S. Civilian Unemployment Rate

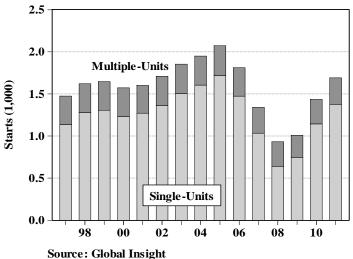

Source: Global Insight

Employment: The current labor market slump is just over a half year old. National nonfarm employment, which had been one of the bright spots in the economy, has declined in every month this year. The latest drop took place in July, when payrolls shrank by another 51,000 jobs. This latest decrease brings the year-to-date job loss to 463,000 jobs. As a result of this string of declines, there were 67,000 fewer jobs in July 2008 than last July. This paucity of employment growth and increase in the labor force has caused U.S. civilian unemployment to climb to 5.7%, which is a full percentage point higher than last year. Construction lost 22,000 jobs this July. It has shed 557,000 jobs since its September 2006 employment peak. Manufacturing lost

another 35,000 jobs, bringing its year-over-year decrease to 383,000 jobs. Layoffs in its temporary help services component caused professional and business services to shrink by 34,000 in July. Not all sectors suffered losses, however. Government payrolls expanded by 25,000 jobs in July, with all the growth coming from state and local governments. Federal government employment actually decreased slightly from June to July. Education/healthcare added 33,000 jobs in July, bringing its year-over-year increase to 368,000 jobs. As was mentioned above, the number of nonfarm jobs in July 2008 was slightly below the previous July's levels. This characteristic is expected to persist through late 2009. On an annual basis, U.S. nonfarm employment is forecast to stall this year and next, before growing 1.4% in 2010 and 1.8% in 2011. The simple arithmetic of stagnant job growth and increasing labor force points to increasing unemployment down the road. Specifically, the nation's unemployment rate is expected to peak at 6.1% in the second quarter of 2009 and hover near that level for almost a year. As the accompanying chart shows, this is above the rate consistent with full-employment.

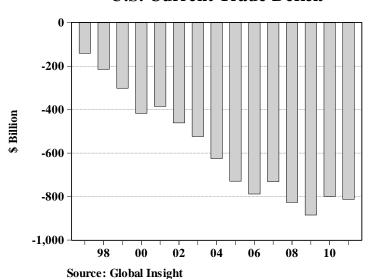

Housing: The ailing U.S. housing market has not yet hit its bottom, but it may be getting closer. One promising statistic is existing home sales have remained near five million units for the last seven months. This is occurring because foreclosures are playing a greater role in the housing market than they ever have before. Banks are pricing homes to sell, which is driving prices down. The 10-City Case-Shiller Composite Index dropped 16.3% year-over-year in April, a record decline. But it was not the only measure showing how drastically prices have fallen. The 20-City Composite Index was down 15.3%, which was also a record. It remains to be seen, however, whether

U.S. Housing Starts

existing home sales can work off the huge inventory overhang. Unfortunately, the new housing sector remains weak. New home sales have not done as well as existing home sales. In addition, single-family housing starts and permits are still falling. However, there is some reason for hope. The rate of decline in single-family starts and permits has slowed. In fact, the May 2008 construction report showed construction spending on single-family homes posted its second smallest drop in ten months. Going forward, the declines are expected to shrink, and housing should become a progressively smaller drag on real GDP growth. It is anticipated that the housing sector will cease to be a drag on the economy beginning in the second quarter of next year, which is two quarters after housing starts bottom out at 818,000 units. On an annual basis, U.S. housing starts are forecast to be 933,000 units in 2008, 1.01 million units in 2009, 1.43 million units in 2010, and 1.69 million units in 2011.

U.S. Current Trade Deficit

International: The trade imbalance is expected to tip favorably toward the U.S. during the next couple of years. The improving nominal trade situation is hard to detect because rising oil prices inflate the import bill. At its worst in the end of this year, the nominal deficit will be only slightly better than at its peak between late 2005 and mid 2006. In the current forecast, the nominal deficit improves only after oil prices retreat. Specifically, nominal net exports go from \$708 billion in 2007 to \$831 billion in 2008, to \$837 billion in 2009, \$693 billion in 2010 and to \$680 billion in 2011. In order to get a more accurate picture of the situation the nominal trade results must be adjusted for inflation. Making this important change shows the

trade situation improves more quickly than the nominal values lead us to believe. Instead of rising through 2009, real exports actually improve \$123 billion this year and another \$111 billion in 2009. However, real exports begin to lose ground after that year because revitalized consumer spending and stepped-up materials demand increase imports. Specifically, real imports accelerate from virtually no growth in 2008 and 2009 to over 6.0% growth in 2010 and 2011. The gap widens further in the out years because of slower export growth. On a current-account basis, the trade deficit is -\$827 billion this year, -\$885 billion next year, -\$799 billion in 2010, and -\$813 billion in 2011.

Business Investment: The next few quarters will be a struggle for real business investment. Real spending on equipment and software is forecast to decline in the second quarter of 2008 and grow slowly in its third quarter. An investment rebound is expected in the fourth quarter, as companies take advantage of the accelerated depreciation allowances that are part of this year's fiscal stimulus package. However, this rise will be followed by a spending drop that is payback for the binge in the fourth quarter of 2008. On an annual basis, real spending on equipment and software is expected to expand 1.7% this year and 0.6% next year. Its pace picks up noticeably beginning in 2010, and averages nearly 7.0% per year through 2011. Real transportation spending is forecast to drop nearly 10% this year and remain flat next year. Spending on industrial equipment faces an uphill challenge as manufacturers wind down their recent spending projects. As a result, inflation-adjusted spending on industrial equipment slides 4.9% in 2008 and 6.1% in 2009.

Government: Fiscal policy is expected to provide the economy with a quick-but-temporary boost. Last winter Congress passed and the President signed into law a stimulus package that is worth \$152 billion in fiscal 2008 (or 1.1% of GDP), of which \$107 billion is for households (via tax rebates) and \$45 billion is for businesses (almost all via 50% bonus depreciation). It is assumed that about three-quarters of the rebates arrived in the second quarter and the rest will be delivered in the following quarter. It is also assumed that 20% of the rebates are spent within three months, 40% within six months, and 50% within a year. Under these assumptions the biggest impact on spending comes in this year's third quarter. This forecast also assumes Congress will not allow all of the Bush administration's personal tax reductions to expire at the end of the decade. But tax burdens are expected to increase, nonetheless, either through the impact of the Alternative Minimum Tax or through some other type of tax reform that raises revenues. On the expenditure side, spending for the wars in Iraq and Afghanistan is expected to climb. Defense spending is expected to rise 9.8% in the current federal fiscal year and 5.9% in the following year. Overall federal outlays are forecast to increase 9.3% in 2008 and 5.7% in 2009. However, slower defense spending in 2010 and 2011 helps tame future overall spending. On a unified budget basis, the federal deficit is predicted to rise from -\$162 billion in 2007 to -\$412 billion in 2008, and to -\$497 billion in 2009. After that year it drops to -\$444 billion in 2010 and to -\$383 billion in 2011.

IDAHO FORECAST DESCRIPTION

The Forecast Period is the Second Quarter of 2008 through the Fourth Quarter of 2011

The outlook for Idaho's economy has been scaled back to reflect more current Idaho historical data and the revised national forecast. A review of new employment data shows the state's economy grew slower during the first part of this year than had been anticipated in April 2008. It was previously projected that nonfarm employment would drop at a 0.3% annual pace in this year's first quarter and grow at a 0.9% clip in the second quarter. Newer job data show employment performed worse than this meager forecast. Namely, nonfarm employment fell at a 2.2% rate in the first quarter and dropped by 0.4% in the second quarter of 2008. As a result of this change, the starting point for the Gem State's employment forecast has been lowered from the previous forecast's 659,800 jobs to 654,595 jobs in the current forecast.

A major feature of the U.S. economic projection used in the preceding forecast was a recession in the first half of this year. This mild slowdown was expected to start in the first quarter of 2008 and end in its second quarter. From its peak to trough, real output was projected to decline just 0.2%. The current forecast also contains a recession. However, instead of starting at the beginning of this year, it occurs at the end of 2008. Specifically, this two-quarter downturn starts in this year's fourth quarter and causes real GDP to shrink 0.6%.

The combination of the lower starting point for the Idaho employment forecast and weaker near-term U.S. economic growth does not bode well for the local economy. Under these conditions Idaho nonfarm employment is expected to expand 1.3% annually over the forecast period, with the first two years being particularly weak. In comparison, nonfarm employment was forecast to increase 1.9% per year in the previous forecast. As a result of the slower growth, there are about 17,500 fewer jobs in 2011 in the current forecast than in the previous one. The goods-producing sector is hit twice as hard as total employment. Due to the much lower construction employment forecast, goods-producing employment is down 5.2% from the previous forecast in 2011. Total Idaho nonfarm employment is down 2.5% in that same year and nongoods-producing employment is off 2.3%.

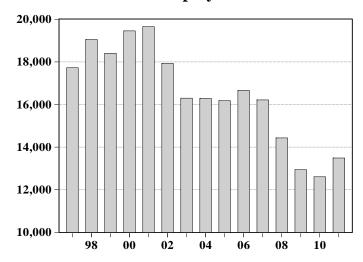

Idaho nominal personal income also falls victim to the weaker economy. It grows slower than had been previously forecasted in each year of the forecast. As a result, the gap between the current and previous forecast widens over time, so that by 2011 Idaho nominal personal income is \$645 million lower than in the previous forecast. Because inflation is higher in the current forecast, the difference between the current and previous measures of Idaho real personal income in 2011 is even more pronounced.

In summary, the next couple of years will be the most challenging in decades for the state's economy. Both Idaho nonfarm employment and nominal personal income are forecast to advance less than one percent over this period. Both should recover beginning in 2010. Over the last two years of the forecast nonfarm employment should expand a total of 4.7%. Idaho real personal income is expected to increase 9.6% over this same period.

SELECTED IDAHO ECONOMIC INDICATORS

Computer and Electronics: Gem State computer and electronics employment is forecast to continue shrinking over the next three years as the state's companies weather the current dip in the global high-tech business cycle. This downturn is due in large part to weak prices caused by the glut of computer memory products. Hardest hit has been Micron Technology. This company is the state's largest private employer and one of the world's largest manufacturers of memory products. In 2007, the company reduced its payroll by 1,100 workers in Idaho in an effort to reduce its productions costs and improve profitability. Unfortunately, prices have continued falling since then, and the company's bottom line has not

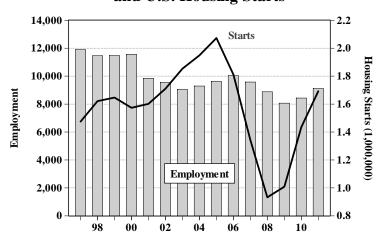

Idaho Computer and Electronic Products Employment

yet returned to black ink. For its most recent quarter of its 2008 fiscal year, which ended May 29, 2008, Micron lost \$236 million. In addition, its stock is trading at near record low prices. However, a close look at the company's financials shows things may not be as bad. First, sales of both its DRAM and NAND Flash products rose in the most recent quarter. Second, the company lowered its costs of goods sold per gigabit for both these products in the third quarter. Third, the company's gross margin was \$48 million—the largest of the fiscal year. The company also reported its sales and gross margin for its CMOS image sensors improved in the third quarter of its fiscal year. Unfortunately, several factors suggest several hurdles remain in this sectors road to recovery. The worldwide imbalance of supply and demand that has depressed prices is not expected to right itself quickly. In addition, this sector will be hamstrung by relatively lackluster U.S. business investment. This sector received another setback when ON Semiconductor announced it was reducing employment at its newly acquired AMI Semiconductor plant in Pocatello by about 200 jobs over the next 18 to 24 months. Growth in the state's high-tech sector will eventually return as new types of manufacturers join existing manufacturers. For example, Nordic Windpower, Limited, a wind turbine manufacturer, plans to hire 160 workers for its new Pocatello plant. In addition, Hoku Scientific is building a \$400 million plant in the same city that is nearly twice as large as had been originally planned to accommodate stronger-than-anticipated demand for the polysilicon it produces. According to the *Honolulu Star Bulletin*, the company has signed a contract worth up to \$298 million to supply polysilicon, a key material in making solar panels, to Jiangxi Kinko Energy Co. Ltd., a China-based manufacturer of silicon products. This deal has filled Hoku's expected 3,500 metric tons of annual capacity. On an annual basis, Idaho computer and electronics employment is forecast to drop 11.0% this year, 10.3% next year, 2.6% in 2010, and increase 7.0% in 2011.

Logging and Wood Products: Idaho's logging and wood sector's declining employment trend was interrupted mid-decade thanks to the red-hot housing market. Specifically, its employment went from a peak of about 12,000 jobs in 1996 to a trough of under 9,100 jobs in 2003. These declines were not the result of soft demand but of ongoing, unfavorable supply factors. Idaho's lumber and wood products sector faces the dwindling timber supply from public forests. According to U.S. Forest Service estimates, the harvest from Idaho national forests fell by 74% from 1996 to 2005. As a result, the

Idaho Wood Product Employment and U.S. Housing Starts

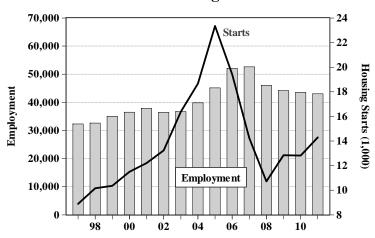

national forests' share of Idaho's timber harvest shrank from 23.9% in 1996 to 8.4% in 2005. This decline resulted in the closure of several older mills around the state. Ironically, these closures help increase the industry's efficiency, which put further downward pressure on employment. The industry does not need as many employees as it has in the past. For example, production was virtually the same in both years even though employment was 16.5% lower in 2006 than it was in 1996. Despite the industry's downsizing, excess capacity remains a challenge. It is estimated the industry can produce 20% to 25% more lumber than is being consumed in North

America. The pressure from these factors on this industry will increase as they fill the void left by the retreating demand fueled by the housing crises. Unfortunately, there is ample evidence this is taking place. Stimson Lumber closed its DeArmond Mill. It had originally planned to shutter the plant in 2009, but low lumber prices forced the company to close it sooner. Three Rivers Timber in Kamiah recently cut its staff by 35 persons. Despite this job contraction, the mills output is expected to remain steady at about 80 million to 90 million board feet per year. Idaho is not the only area suffering; the entire inland region has fallen on hard times. The June 2008 edition of *Random Lengths Yardstick* included a couple of statistics that illustrate this point. First, there are about half as many mills in the inland region as there were twenty years ago. Second, the inland region's share of North American (U.S. and Canada) production has dwindled from 18% to 8%. These facts do not bode well for this sector's health. As the housing sector retreats, so will Idaho lumber and wood products employment. Specifically, it is expected to decline 7.3% this year and 9.1% next year. Later in the forecast period, employment is forecast to post a modest rally, so that by 2011 there are 9,116 jobs in this sector.

Construction: Idaho construction employment is expected to decline throughout the forecast period as the dust from the state's housing sector decline settles. The jobs will be sorely missed, as construction

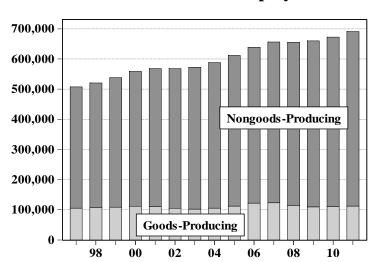

was one of Idaho's growth industries in recent years. Idaho construction employment enjoyed several quarters of double-digit growth that culminated with a peak of 53,552 jobs in the first quarter of 2007. What this figure does not capture is how long construction has contributed to the state's growth. Remarkably, Idaho construction employment has increased in 15 of the 16 years since 1991—the most consistent showing among the state's goods-producing sectors. During this period the construction payroll exploded from 20,350 to 52,634, which is a 6.1% average annual growth rate—about twice as fast as the state's total nonfarm job growth

Idaho Construction Employment and Housing Starts

rate of 3.2%. This strong job expansion was fueled by the housing surge caused by the state's fast growing population. Idaho housing starts increased from about 6,600 units in 1991 to a high of about 23,400 units in 2005. Although housing starts declined by about 3,200 units the next year, construction employment continued to grow thanks to strong nonresidential building in 2006. The number of housing starts fell another 5,200 units in 2007, and this year employment also declined. Housing is expected to fall further this year to about 10,700 units and construction employment should retreat to about 46,100 jobs. This year marks the low watermark for housing starts. After 2008, housing starts should rise to about 12,800 units next year and remain there through 2010. Housing starts should recover further in 2011 to 14,300 units. Unfortunately, Idaho construction employment will take longer to recover. Specifically, this forecast shows there are 44,204 jobs in 2009, 43,569 jobs in 2010, and 43,028 in 2011.

Idaho Nonfarm Employment

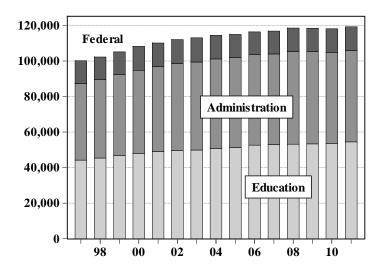

Nongoods-Producing Industries: The current forecasts for the state's services and trade sectors have been scaled down from their April 2008 counterparts. In the previous forecast Idaho services employment was projected to expand an average of 3.1% annually over the forecast period. It grows just 2.4% per year in the current forecast. As a result of this slower growth, total services employment in 2011 is down by 8,000 compared to the previous forecast. It should be noted that there were three significant changes in the first quarter of this year that deserve an explanation. First, the quarterly data show professional and business services employment

dropped at a 12.4% annual rate. This decline reflects reductions by employment agencies, companies providing building services, and call centers. Coincidentally, a large part of this drop was made up by hiring at private universities that helped education- and health-related employment to surge at a 9.1% annual clip in the first quarter. Last, other services employment sprinted at a nearly 25% pace due to a new employment survey that revealed there were more noncovered jobs in this sector than had been previously reported. This new data creates a series break that results in a one-time boost to the first quarter's growth rate. Leisure and hospitality employment was flat in the first half of this year, even though the state enjoyed the best winter conditions in several years. This decline may have resulted from reduced consumer spending because of worries over the economy's direction as well as high transportation costs. These two factors probably contributed to the retail sector's disappointing performance in the first half of this year. In April it was anticipated this sector's employment would grow about 2.5% per quarter. It was flat instead. Wholesale trade employment actually shrank in the first quarter. Even after posting a meager rally in the next quarter, it was still about 500 jobs lower than had been forecasted earlier. Total trade employment is forecast to rise 2.8% annually, which is down from the 3.3% expected pace in the April 2008 forecast.

Government: The anticipated slower population growth will cool Idaho public job growth over the next few years. The Gem State's population growth peaked at 2.7% in 2005 thanks to an influx of new residents. That year marked the first time since 1995 that net migration topped 20,000 persons. It remained above this threshold for the next two years, causing the state's population to rise 2.6% in 2006 and 2.5% in 2007. However, migration is expected to drop below 20,000 persons this year. Absent the

strong migration, Idaho's population advances about 1.8% annually. History suggests Idaho state and local employment prospects will be dampened by the slower population growth. The demands of the growing population put pressure on existing government resources, so government employment expands to meet this demand. If population growth slows, so does government employment. From 1991 to 2000, Idaho's population increased about 2.5% per year. Over this same period, Idaho state and local government expanded 3.0% annually. The state's population growth slowed to a 1.7% annual pace from 1999 to 2004. State and local government employment

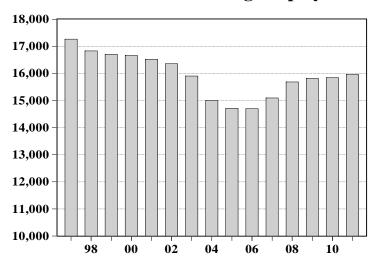

Idaho Government Employment

growth followed suit, slowing to an average 1.9% annual pace. Given the slower population growth, Idaho state and local government employment is projected to increase about 0.5% annually over this period. However, growth rates vary widely between the education- and noneducation-related components. Idaho education employment is expected to advance about 0.7% per year from 2007 to 2011. During this same period, noneducation-related government employment should expand just over 0.2% annually. Federal government employment in Idaho has hovered near 13,000 jobs over the last few years, and it is projected to continue doing so over most of the forecast horizon. However, it should rise above 13,500 jobs in 2010, the result of local hiring for the 2010 census.

Mining: Idaho's mining sector is expected to extend its current job-growth streak by expanding another 8.1% this year. This expansion is being fueled by high metal prices that have increased payrolls from just under 1,800 jobs in 2002 to a forecasted 2,885 jobs in 2008. Companies adding workers include such Silver Valley icons as Sunshine, Lucky Friday, and Galena mines. Kathryn Tacke, the Idaho Department of Labor's Regional Economist for North Idaho reported that prices of lead and zinc are so high that the Lucky Friday Mine could make a profit on sales of these two byproducts alone. However, the ore also contains silver, which has been selling for prices north of \$17 per ounce recently. These high prices have increased exploration activity in the state. U.S. Silver is exploring the potential of the Calladay project near its Galena Mine, the Dayrock lead-zinc mine, and the Gem State property near the Golconda District. The company has found multiple veins at the 2,400-foot level that may contain highgrade ore. The company is also examining the possibility of reactivating Coeur Mine to access some of the mineralized zones left when it closed in 1998. Other companies are also active in the Silver Valley. New Jersey Mining Company plans to spend over \$1.7 million to explore gold, silver, and copper properties in Shoshone County. SNS Silver is looking at the possibility of bringing the Crescent Mine near Kellogg back into production. The Crescent, which closed in the 1980s, lies between two of the world's greatest silver producers—the Sunshine and Bunker Hill mines. It appears there are ample mineral supplies for further expansion. For example, the 65-year old Lucky Friday Mine has more silver in reserve than has been mined over the years and could be expanded for decades. But this sector's short-term fortunes will be driven more by economics than by geology. The expected cooling of the national economy suggests demand for metals should slow, and this will dampen the state's mining employment outlook. However, the retreat from current levels should be modest. Specifically, Idaho mining employment is forecast to drop to 2,715 jobs in 2009 and fall to 2,654 jobs in 2010 and remain near that level in 2011.

Idaho Food Processing Employment

Food Processing: Idaho's food processing sector recently took its first step towards reclaiming its title as the state's largest manufacturing employer. Prior to 1997, this sector employed more workers than any other manufacturing sector. However, it ceded this title in 1997 when it was overtaken by the hightech. The next year marked the first in what was to be a series of annual food processing employment losses. As a result, this sector was not in position to make a run for the championship until recently. Its fortunes began improving as new companies arrived on the scene, in some cases replacing companies that had been shut down. For example, the former

Swift and Company beef processing plant has been reopened by XL Foods, Inc. Gossner Foods, Inc. opened a new cheese manufacturing plant in Heyburn on land formerly occupied by the J.R. Simplot plant. Brewster Dairy, Inc. has taken over the former Kraft plant in Rupert. Marathon Cheese is building a \$27-million plant in Mountain Home that will employ 250 workers. The plant's employment should climb to twice that many jobs in five years. Another new plant is High Desert Milk in Burley. When completed, this plant will employ 30 workers to manufacture powdered milk. Idaho Milk Products broke ground on a 180,000-square-foot facility in Jerome in late October. Once operational, the plant will process about 3 million gallons of milk per day into protein powders, lactose permeate, and cream. This recovery is important because food processing is an essential part of the Gem State's economy. This sector had 14,700 jobs in 2006, making it the state's second largest manufacturing employer. Idaho food processing employment is forecast to rise 3.9% this year, which will help it regain its title as the state's largest manufacturing employer. It will retain this top spot by increasing its payroll by 0.8% next year, 0.2% in 2010, and 0.7% in 2011. Other measures also point to this sector's importance. The real value of food manufacturing output accounted for more than half (55.6%) of the total Idaho nondurable manufacturing output from 1997 to 2006 and about 2.4% of the state's total gross domestic product.

FORECASTS COMPARISON

Idaho has a dynamic economy whose growth is influenced by a myriad of local, national, and international factors. Therefore, changes to the projected values of such diverse variables as oil prices, interest rates, and national housing starts can have an effect at the state level. In order to account for the effects of such changes on the state's economy, each issue of the *Idaho Economic Forecast* uses Global Insight's most recent forecast of the U.S. economy. Additional data, such as company-specific expansions and/or contractions are also considered.

The following comparison table shows how the outlooks for several key Idaho and national economic series have changed from the April 2008 to the July 2008 *Idaho Economic Forecast*. The April 2008 *Idaho Economic Forecast* is based on Global Insight's April 2008 baseline forecast and the July 2008 *Idaho Economic Forecast* is driven by Global Insight's July 2008 baseline U.S. macroeconomic forecast. In addition, an interim forecast was prepared in February 2008 in response to fast-changing national economic conditions. The summary table for the interim economic forecast is available at Idaho Division of Financial Management's (DFM) website.

Several key variables show how the forecasts for the national and state economies have changed compared to the April 2008 *Idaho Economic Forecast*. The outlook for the national economy has taken an interesting turn, with a slightly stronger showing this year followed by a weaker showing in 2009. In April 2008 it was forecast the economy would slip into a mild, two-quarter recession beginning in the first quarter of 2008. However, it now appears the economy was stronger than had been previously believed. Real GDP grew by 0.9% in the first quarter instead of declining and advanced 1.9% in the second quarter. The stronger showing during this year's first half does not mean a recession has been avoided; instead, it has been postponed. The quarterly data shows real GDP is expected to shrink in the last quarter of this year and the first quarter of next year. As a result, real GDP is 0.4% higher than in the previous forecast in 2008, but 0.4% lower in 2009. After 2009, real output is slightly (0.2%) higher than in the April 2008 Idaho Economic Forecast. The weaker economy exacts a toll on both income and employment from which neither fully recover over the forecast period. In 2009, real personal income is \$216 billion down from the previous forecast. Despite the slightly faster real GDP growth, it fails to totally make up this deficit, and by 2011 it is still \$82 billion below the previous forecast. Part of this difference reflects the projected higher inflation in the July 2008 forecast. The national employment recovery also fails to achieve parity with its predecessor. It goes from having 713,000 fewer jobs in 2009 to 286,000 fewer jobs in 2011.

Idaho's economic outlook is lower in the current forecast than in the April 2008 forecast. There are several reasons for this change. Nonfarm employment starts from a lower-than-expected level and grows slower than in the previous forecast. This combination makes the employment gap between the two forecasts grow wider with time. Specifically, Idaho nonfarm employment is 0.8% lower in the current forecast in 2008, 1.6% lower in 2009, 2.0% lower in 2010, and 2.5% lower in 2011. Looked at another way, in the terminal year of this forecast there are about 17,500 fewer jobs than in the April 2008 forecast. The gap between current and previous Idaho nominal personal income also widens over time, going from -0.1% in 2008 to -1.1% in 2011. As a result, Idaho nominal personal income is \$645 million lower in 2011 compared to the previous forecast.

ALTERNATIVE FORECASTS

Global Insight has assigned a 60% probability of occurrence to its July 2008 baseline forecast of the U.S. economy. The major features of this forecast include:

- Real GDP increases 1.6% in 2008, 0.9% in 2009, 3.6% in 2010, and 3.4% in 2011;
- U.S. nonfarm employment grows 0.1% in 2008, 0.0% in 2009, and 1.4% in 2010, and 1.8% 2011:
- the annual U.S. civilian unemployment rate climbs to a peak of 6.0% next year then gradually declines to 5.2% in 2011;
- consumer inflation is 5.3% in 2008, 3.3% in 2009, 0.5% in 2010, and 1.3% in 2011;
- the current account deficit is \$827 billion in 2008, \$885 billion in 2009, \$799 billion in 2010, and \$813 billion in 2011;
- the federal unified budget deficit is \$412 billion in 2008, \$497 billion in 2009, \$444 billion in 2010, and \$383 billion in 2011.

OPTIMISTIC SCENARIO

Global Insight's *Optimistic Scenario* has been assigned a 20% probability of occurrence. Renewed strength in total factor productivity growth provides the key assumption distinguishing this scenario from the baseline. Total factor productivity, a measure of how technological progress augments economic growth, is enhanced by reinvigorated innovation in the technology sector. Stronger productivity gains, coupled with renewed optimism, facilitate enhanced business spending and a milder housing contraction. The stimulus package already in the pipeline adds fuel to the fire during the latter half of 2008. Productivity growth remains higher than in the baseline over the next decade, providing for stronger long-term growth, more employment, and lower budget deficits. Combined with a stronger currency, the productivity gains also help to contain inflation. Like its domestic cousin, foreign economic growth is also stronger. This strength helps boost U.S. exports and domestic manufacturing. As a result, real exports rise faster despite the stronger greenback. Finally, this scenario assumes energy prices are lower than in the baseline.

Under these assumptions, the economic outlook is much brighter. After recording 2.3% growth in this year's second quarter, real GDP accelerates to a 3.5% pace in the third quarter—more than twice as fast as in the baseline. As a result, real output shows respectable growth both this year and next in this scenario, while it sputters in the *Baseline Scenario*. Specifically, real GDP advances 2.1% in 2008 and 2.5% in 2009. In the baseline case the measure increases 1.6% in 2008 and 0.9% in 2009. Most significantly, this scenario is the only one of those covered here that avoids a recession during the forecast period.

The stronger national economy pays dividends in Idaho, with both employment and personal income outperforming their baseline counterparts. Total nonfarm employment advances faster in every year of the forecast, so that by 2011 there are about 11,000 more jobs than in the *Baseline Scenario*. The bulk of this increase is the nongoods-producing sector that advances faster over the forecast period, adding about 10,500 jobs to the difference. The remainder is made up of goods-producing employment. Interestingly, Idaho nominal personal income growth outpaces its baseline cousin only in the first two years of the forecast, but this is enough of a head start to enjoy a \$66 million advantage in 2011. After adjusting for inflation, the personal income gap grows much wider because much of the baseline's nominal personal income growth was due to higher inflation.

Forecast Begins the SECOND Quarter of 2008

PESSIMISTIC SCENARIO

The *Pessimistic Scenario* has been assigned a 20% probability of occurrence. This scenario assumes the housing recession deepens even more than in the baseline and the price of oil shoots above \$160 per barrel this summer. This fatal combination sends the economy into a full-blown recession. Despite the effects of the stimulus package, real GDP tumbles. After the impact of the stimulative monetary and fiscal policies wear off, the economy contracts over two additional quarters. Peak to trough, real GDP shrinks 1.7% during these three quarters (2008:3 to 2009:1). Like the recessions of 1991 and 2001, this one is still mild compared with earlier postwar recessions. Unlike the past two recessions, however, the economy remains on the ropes longer and emerges from the downturn weaker, facing more troubles ahead.

On an annual basis, real output increases a meager 1.1% in 2008 and contracts by 0.9% in 2009. In comparison, real GDP is forecast to rise 1.6% this year and 0.9% next year in the *Baseline Scenario*. Employment drops for seven straight quarters (losing two million jobs) and industrial production falls in five of six quarters. Over the longer term, real GDP advances slower than in the *Baseline Scenario*, mainly because productivity advances only 1.5% annually over the next ten years, compared with the baseline's 2.0% pace. Inflation is higher in the *Pessimistic Scenario* because of the slower productivity growth and the weaker dollar. It also reflects the Federal Reserve's policy to live with 3.0% inflation rather than risk another recession by trying to bring it lower.

Ripples from the weaker national economic growth cause the state's economy to experience sub-par growth over the forecast period. Most notably, Idaho nonfarm employment grows much slower, causing it to be about 23,700 lower than in the baseline. Employment actually falls during the first two years of the forecast before eking out meager gains in 2010 and 2011. The goods-producing sector is particularly hard hit, posting losses through 2010. As with employment, Idaho nominal personal income growth is also weaker in each year of the forecast. The combination of weak growth and higher inflation causes Idaho real personal income to retreat in both 2008 and 2009. Given this bad start, it is no surprise it is about \$1.9 billion lower in 2011 than in the *Baseline Scenario*.

Consumer Sentiment and Consumer Spending

James A. Wilcox¹

In the U.S. economy, two-thirds of production and expenditures are devoted to consumer spending, or personal consumption expenditures (PCE), which include most of retail sales, as well as households' expenditures on such items as rent, utilities, and much of medical care. Because this is such a large sector of the economy, the forecast accuracy of PCE affects the forecast accuracy of some of the key variables that policymakers focus on, such as unemployment, incomes, inflation, and interest rates. A large body of research has documented that measures of income, wealth, and interest rates, which indicate consumers' *ability* to spend, do consistently help forecast future consumer spending. The research results are less consistent, however, for forecast models that also include measures of consumers' *willingness* to spend, such as the University of Michigan's Index of Consumer Sentiment (ICS). Nonetheless, at some times, measures of consumer attitudes do seem to provide additional information about households' future spending; one such example is the period near the 1990-1991 recession.

This *Economic Letter* describes how the ICS is constructed and reviews some past research on whether measures of consumer attitudes improve forecasts of consumer spending. It also reports on some new research, which found that using the answers to the individual component questions of the ICS, rather than the ICS itself, further improved forecasts of PCE and its components. Finally, it shows how much and when measures of consumer attitudes might have helped forecasts in recent years.

Component questions of the ICS

From the large number of questions that it asks households, the University of Michigan's Survey Research Center constructs the ICS by aggregating the answers to five questions. (The possible answers to the five questions that are used to construct the ICS are shown in brackets below.)

- 1. "We are interested in how people are getting along financially these days. Would you say that you (and your family living there) are better off or worse off financially than you were a year ago?" [better off, same, worse off, or don't know]
- 2. "Now looking ahead—do you think that a year from now you (and your family living there) will be better off financially, or worse off, or just about the same as now?" [better off, same, worse off, or don't know]
- 3. "Now turning to business conditions in the country as a whole—do you think that during the next 12 months we'll have good times financially, or bad times, or what?" [good times, uncertain, bad times, don't know]
- 4. "Looking ahead, which would you say is more likely—that in the country as a whole we'll have continuous good times during the next 5 years or so, or that we will have periods of widespread unemployment or depression, or what?" [good times, uncertain, bad times, don't know]

1

¹ This article originally appeared in the Number 2008-19; June 27, 2008 *FRBSF Economic Letter*. Opinions expressed in this article are those of the authors and do not necessarily reflect the views of the management of the Federal Reserve Bank of San Francisco or the Board of Governors of the Federal Reserve System.

5. "About the big things people buy for their homes—such as furniture, a refrigerator, stove, television, and things like that. Generally speaking, do you think now is a good or a bad time for people to buy major household items?" [good time, uncertain, bad time]

Why consumer attitudes might improve forecasts

Measures of consumer attitudes, such as the ICS, might improve consumption forecasts for several reasons. First, while most other macroeconomic data report what already happened, the ICS data report on consumers' views about their own and the economy's recent, *current*, and *expected* economic conditions. Thus, these data may be more informative about future consumer spending.

Second, consumer attitudes may incorporate households' estimates of the impacts of rare or even unique shocks, whose effects cannot be directly estimated from past experience or data. Such events might include the first oil embargo and oil price shock in the mid-1970s, the Gulf wars, the effects of Hurricane Katrina, or even a dramatic surge in oil prices to well over \$100 per barrel. Such shocks could include events or policies that importantly change how the economy operates. For example, if a new Fed Chair were widely anticipated to follow a distinctly different monetary policy from his predecessor's, consumer attitudes then might well incorporate how households, businesses, and the entire economy might react differently to various economic and financial events. The changed responses of consumer spending would not typically be forecastable from macroeconomic data.

Third, households' answers might reflect changed expectations and uncertainties about future conditions that have not yet occurred. For example, significant changes in political candidates' election prospects might lead households to have both higher expectations of and higher uncertainty about future taxes. As a result, the numbers of households who answer that this is a good time to buy major household goods might well decline, followed by actual declines in such purchases. These repercussions on households' expectations and on their spending often would not be captured by the macroeconomic variables that are typically used to forecast consumer spending.

Some results of previous research

Research has long noted a strong, positive correlation between consumer attitudes and consumer spending. The empirical evidence, however, is less consistent about whether, once other macroeconomic variables are allowed for, consumer attitudes forecast consumer spending. Juster and Wachtel (1972a, b), for example, reported that "anticipatory variables" (including the ICS) were of considerable importance in forecasting expenditures on autos. Kelly (1990) reported that consumer attitudes directly affected consumer spending, imports, business inventories, and industrial production. In addition, Carroll, Fuhrer, and Wilcox (1994) reported that consumer attitudes further improved consumption forecasts, even after other macroeconomic variables were allowed for.

In other studies, however, consumer attitudes did not significantly improve consumption forecasts when macroeconomic variables (such as income, interest rates, assets, or liabilities) were taken into account. Hymans (1970) pointed out that in the majority of econometric models, consumer attitudes played little if any part. Mishkin (1978) found that, once the effects of financial assets and liabilities were considered, the effects of consumer attitudes were typically insignificant. Further, the large, multi-equation forecasting models of the Federal Reserve, of the OECD, and of some consultancies historically omitted consumer attitudes from their equations for forecasting consumer spending.

Recent research

Wilcox (2007) compared models for forecasting consumer spending without measures of consumer attitudes to models with them. The study evaluated the forecasting improvements attributable to the ICS

and to each of its component questions. The study used national aggregate data for 1960-2006 for (annualized growth rates of seasonally adjusted, real, per capita) consumer spending, personal disposable income, and household wealth. Consumer spending was measured by PCE. The study also evaluated forecasts of the components of PCE: durables (including expenditures on vehicles and on nonvehicle durables), nondurable goods, and services. To explore further the forecasting contributions of consumer attitudes, out-of-sample forecasts were calculated for each year from 2000 through 2005.

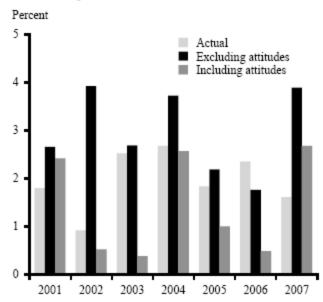

The baseline models used in the study were fairly similar to those used by Carroll, Fuhrer, and Wilcox (1994), Bram and Ludvigson (1998), and others: the models forecast the annualized, one-quarter-ahead and four-quarter-ahead growth rates of consumption (and each of its components), based on four quarterly lags of the forecasted variable, of income, of the home-equity and non-home-equity components of household net worth, and the levels of interest and inflation rates. Interest and inflation rates were represented by the one-year nominal interest Treasury bill yield and the year-over-year percent change in the seasonally adjusted, quarterly average, consumer price index.

Forecasting results

- —Earlier studies typically focused on the ICS, which aggregates the answers to the five questions above. In contrast, this study found that the individual component questions were much more informative about future consumption than the aggregate ICS. For instance, answers to Question 5 more reliably improved year-on-year forecasts of total consumption growth and each of its components than did either the ICS or any of the other four questions.
- —Earlier studies focused on the usefulness of the ICS for forecasting consumption for the next calendar quarter. This study found that the individual component questions (and the ICS) much more reliably improved forecasts for a longer, four-quarter horizon.
- —Earlier studies found that consumer attitudes improved forecasts of expenditures on durables and, in particular, on the vehicles component of durables. The study found that the individual component questions of the ICS improved not only forecasts of expenditures on durables but also forecasts of expenditures on nondurables and on services.
- —Earlier studies focused on whether consumer attitudes improved forecasts after considering the effects of income, wealth, and interest rates. The study found that the individual questions tended to improve forecasts of PCE and of its components as much as, or more than, macroeconomic variables did.
- —The study also found that including the ICS or its components improved forecasts for recent years.

Figure 1 shows the actual growth rate of (real, per capita) PCE for each year during 2001-2007 and two sets of forecasts that, for each year, could have been made from the end of the prior year. The middle bar for each year shows forecasts based on models that excluded any questions

Figure 1 Actual consumption growth and forecasts excluding and including consumer attitudes

about consumer attitudes ("excluding attitudes"). The rightmost bar shows forecasts based on models that included all five component questions of the ICS ("including attitudes"). Forecasts excluding the questions averaged about 1 percentage point above, while forecasts including them averaged about ½ percentage point below, actual consumption growth. By that measure, forecasts including the questions were more accurate.

Increases or decreases in accuracy seem to align with periods of weakness or strength in the economy. Forecasts including the ICS questions were more accurate when consumption growth was falling (as in the 2001 recession) or low (as in the sluggish recovery year of 2002) and when the economy was slowing (as in 2007). Forecasts excluding the ICS questions were more accurate when the economy and consumer spending were booming (as in 2005 and 2006). Thus, the forecasting contributions of consumer attitudes seem stronger when the economy is weaker, although, admittedly, the reasons for these results are not yet fully understood. Given the importance and difficulty of forecasting when the economy is weaker, that strength may appear just when it is most valuable to analysts and policymakers.

FORECAST DETAIL

| Annual Forecast 1994-2011 | Page 30 |
|------------------------------|---------|
| Quarterly Forecast 2005-2010 | Page 44 |

Reporting Conventions

Units of measurement are presented in the individual reports.

The percentage change numbers given in the annual reports are simple period-to-period percent changes. Since the periods are years, they are thus simple annual changes. The percentage changes given in the quarterly report are period-to-period changes at compound annual rates, following standard practice. A large change in a given quarter can seem to be exaggerated since the calculation assumes the change is compounded over an entire year.

Data Sources

National forecast data is provided by Global Insight, as well as the Food and Agricultural Policy Research Institute (FAPRI). Historical data for the models are obtained from the following agencies: Bureau of the Census (demographic), Bureau of Economic Analysis (income), Bureau of Labor Statistics (employment), Federal Reserve Board of Governors (production), and U.S. Department of Agriculture (farm).

Idaho historical data is obtained from the Department of Commerce and Labor (employment and hourly earnings), Bureau of Vital Statistics (births and deaths), Division of Financial Management (migration), and the Bureau of Economic Analysis (income).

The Idaho average annual wage is calculated by the Division of Financial Management from Bureau of Economic Analysis and Idaho Department of Commerce and Labor data. Because of the different methodology used and data available, this figure may not match those published by other sources.

THE GLOBAL INSIGHT U.S. MACROECONOMIC MODEL

Global Insight's Macroeconomic Model is a multiple-equation model of the U.S. economy. Consisting of over 1,200 equations, the model is solved iteratively to generate the results of different policy and forecast scenarios. The model incorporates the best insights of many theoretical schools of thought to depict the economic decision processes and interactions of households, businesses, and governments.

The Global Insight model is divided into the following eight major sectors:

- I Private Domestic Spending
- **II** Production and Income
- III Taxes
- **IV** International Transactions
- V Financial
- VI Inflation
- VII Supply
- VIII Expectations
- I. **Private Domestic Spending.** Major aggregate demand components include consumption, investment, and government. Consumer purchases are divided among three categories: durable goods, nondurable goods, and services. In nearly all cases, real expenditures are influenced by real income and the relative price of consumer goods. Durable and semidurable goods are also sensitive to household net worth, current finance costs, and consumer sentiment.

Global Insight divides investment into two general categories: fixed investment and inventories. The former is driven by utilization rates, capital stock, relative prices, financial market conditions, financial balance sheet conditions, and government policies. Inventory investment is heavily influenced by such factors as past and present sales levels, vendor performance, and utilization rates.

The government sector is divided into federal government and state and local government. Most of the federal expenditure side is exogenous. Federal receipts are endogenous and divided into personal taxes, corporate taxes, indirect business taxes, and contributions for social insurance. State and local sector receipts depend primarily on federal grants and various tax rates and bases. State and local government spending is driven by legal requirements (i.e., balanced budgets), the level of federal grants (due to the matching requirements of many programs), population growth, and trend increases in personal income.

II. **Production and Income.** The industrial production sector includes 74 standard industrial classifications. Production is a function of various cyclical and trend variables and a generated output term, i.e., the input-output (I-O) relationship between the producing industry and both intermediate industries and final demand. The cyclical and trend variables correct for changes in I-O coefficients that are implied by the changing relationship between buyers and sellers.

Pre-tax income categories include private and government wages, corporate profits, interest rate, and entrepreneurial returns. Each of these categories, except corporate profits, is determined by some combination of wages, prices, interest rates, debt levels, capacity utilization rate, and unemployment rate. Corporate profits are calculated as the residual of total national income less the nonprofit components of income mentioned above.

- III. **Taxes.** The model tracks personal, corporate, payroll, and excise taxes separately. Tax revenues are simultaneously forecast as the product of the rate and the associated pre-tax income components. The model automatically adjusts the effective average personal tax rate for variations in inflation and income per household, and the effective average corporate rate for credits earned on equipment, utility structures, and R&D. State taxes are fully endogenous, except for corporate profits and social insurance tax rates.
- International. The international sector can either add or divert strength from the central flow of domestic income and spending. Imports' ability to capture varying shares of domestic demand depends on the prices of foreign output, the U.S. exchange rate, and competing domestic prices. Exports' portion of domestic spending depends on similar variables and the level of world gross domestic product. The exchange rate itself responds to international differences in inflation, interest rates, trade deficits, and capital flows between the U.S. and its competitors. Investment income flows are also explicitly modeled.
- V. **Financial.** The Global Insight model includes a highly detailed financial sector. Several short- and long-term interest rates are covered in this model, and they are the key output of this sector. The short-term rates depend upon the balance between the demand and supply of reserves in the banking system. The supply of reserves is the primary exogenous monetary policy lever within the model, reflecting the Federal Reserve's open market purchases or sales of Treasury securities. Longer-term interest rates are driven by shorter-term rates as well as factors affecting the slope of the yield curve. These factors include inflation expectations, government borrowing requirements, and corporate finance needs.
- VI. **Inflation.** Inflation is modeled as a controlled, interactive process involving wages, prices, and market conditions. The principal domestic cost influences are labor compensation, nonfarm productivity, and foreign input costs that later are driven by the exchange rate, the price of oil, and foreign wholesale price inflation. This set of cost influences drives each of the industry-specific producer price indexes, in combination with a demand pressure indicator and appropriately weighted composites of the other producer price indexes.
- VII. **Supply.** In this model, aggregate supply (or potential GNP), is estimated by a Cobb-Douglas production function that combines factor input growth and improvements to total factor productivity. Factor input equals a weighted average of labor, business fixed capital, and energy. Factor supplies are defined by estimates of the full employment labor force, the full employment capital stock net of pollution abatement equipment, the domestic production of petroleum and natural gas, and the stock of infrastructure. Total factor productivity depends upon the stock of research and development capital and trend technological change.
- VIII. **Expectations.** Expectations impact several expenditure categories in the model, but the principal nuance relates to the entire spectrum of interest rates. Shifts in price expectations or the expected government capital needs influences are captured directly in this model through price expectations and budget deficit terms. The former impacts all interest rates and the latter impacts intermediate- and long-term rates. On the expenditure side, inflationary expectations impact consumption via consumer sentiment, while growth expectations affect business investment.

THE IDAHO ECONOMIC MODEL

The Idaho Economic Model (IEM) is an income and employment based model of Idaho's economy. The Model consists of a simultaneous system of linear regression equations, which are estimated using quarterly data. The primary exogenous variables are obtained from the Global Insight U.S. Macroeconomic Model. Endogenous variables are forecast at the statewide level of aggregation.

The focal point of the IEM is Idaho personal income, which is given by the identity:

personal income = wage and salary payments + other labor income + farm proprietors' income + nonfarm proprietors' income + property income + transfer payments - contributions for social insurance + residence adjustment.

With the exception of farm proprietors' income and wage and salary payments, each of the components of personal income is estimated stochastically by a single equation. Farm proprietors' income and wage and salary payments each comprise submodels containing a system of stochastic equations and identities.

The farm proprietor sector is estimated using a highly-aggregated submodel consisting of equations for crop marketing receipts, livestock marketing receipts, production expenses, inventory changes, imputed rent income, corporate farm income, and government payments to farmers. Farm proprietors' income includes inventory changes and imputed rent, but this component is netted out of the tax base.

At the heart of the IEM is the wage and salary sector, which includes stochastic employment equations for 23 North American Industry Classification System employment categories. Conceptually, the employment equations are divided into basic and domestic activities. The basic employment equations are specified primarily as functions of national demand and supply variables. Domestic employment equations are specified primarily as functions of state-specific demand variables. Average annual wages are estimated for several broad employment categories and are combined with employment to arrive at aggregate wage and salary payments.

The demographic component of the model is used to forecast components of population change and housing starts. Resident population, births, and deaths are modeled stochastically. Net migration is calculated residually from the estimates for those variables. Housing starts are divided into single and multiple units. Each equation is functionally related to economic and population variables.

The output of the IEM (i.e., the forecast values of the endogenous variables) is determined by the parameters of the equations and the values of exogenous variables over the forecast period. The values of equation parameters are determined by the historic values of both the exogenous and endogenous variables. IEM equation parameters are estimated using the technique of ordinary least squares. Model equations are occasionally respecified in response to the dynamic nature of the Idaho and national economies. Parameter values for a particular equation (given the same specification) may change as a result of revisions in the historic data or a change in the time interval of the estimation. In general, parameter values should remain relatively constant over time, with changes reflecting changing structural relationships.

While the equation parameters are determined by structural relationships and remain relatively fixed, the forecast period exogenous variable values are more volatile determinants of the forecast values of

endogenous variables. They are more often subject to change as expectations regarding future economic behavior change, and they are more likely to give rise to debate over appropriate values. As mentioned above, the forecast period values of exogenous variables are primarily obtained from Global Insight's U.S. macroeconomic model.

Since the output of the IEM depends in large part upon the output of the Global Insight model, an understanding of the Global Insight model, its input assumptions, and its output is useful in evaluating the results of the IEM's forecast. The assumptions and output of the Global Insight model are discussed in the National Forecast section.
